

# 3 servers infrastructure - I

→ 2 servers provide redundancy.

→ Load Balancer receives requests and forwards them.

≠ Algorithms : . Active - Passive setup .

Always go to 1 server, switch if it is down.

The other server is a copy of the first.

. Active Active setup .

Alternate → round robin

→ weighted round robin =  $f(\text{server characteristics})$

→ dynamic " " =  $f(\text{server monitoring})$

.....

Database has Master/Slave setup
